Executive Summary

As a marketing strategist, I am reporting a sentiment analysis on a Subreddit: AskACanadian. It is a resource for answers to questions about any topic with regards to Canada. The key findings of this analysis are time-based, how sentiments change by the week and the hour of the day; word frequency, which words appear most often for positive vs negative posts; average upvotes based on the category of the sentiments. Toward the end, recommendations have been made based on our findings

Methodology

Using N8N, I have retrieved data from AskACanadian into a google sheet. In the first chart, using the positive, negative and neutral sentiments the days of the week have been analyzed to observe which sentiment has the highest frequency on which day. The second chart takes the sentiments into consideration again but this time with the hours of the days: the sentiment count for each hour of the day. The third and fourth chart visualize the frequency of certain words within the data set. The third correlates to the positive frequency and the fourth correlates to the negative frequency. The last two visualizations show the distribution of upvotes across the three sentiments, with the negative sentiment having the highest upvotes.

Sentiment Analysis Results

1. Sentiment by Day of the Week:
 - a. Positive sentiment posts peak on certain weekdays.
 - b. Negative sentiment fluctuates but is present throughout the week.
 - c. Neutral sentiment is more evenly distributed.
2. Sentiment by Hour of the Day:
 - a. Specific hours show spikes in positive or negative sentiment.

- b. Understanding these trends can optimize content posting times.
3. Word Frequency Analysis:
 - a. Positive sentiment posts frequently include words reflecting support and appreciation.
 - b. Negative sentiment posts contain terms associated with frustration or concern.
4. Upvote Distribution by Sentiment:
 - a. Negative sentiment posts receive the highest average upvotes, indicating stronger engagement.

Key Insights

- Negative sentiment posts tend to gain more traction, possibly due to emotional responses.
- Certain timeframes show a higher likelihood of positive or negative engagement.
- Understanding common words in sentiment types can help tailor responses and messaging strategies.

Business Recommendations

Firstly, schedule content based on high engagement hours to reach maximum people. Another point would be to use insights from word frequency analysis to create content that resonates with those sentiments. Lastly, would be to regularly update the analysis to track changes in sentiment trends and adjust strategies accordingly.

Future Research
